AUTHORS: Ragozin, N. A., and Vorob'yeva, A. F. 65-58-4-7/12

TITLE: The Inflammability of Jet Fuels (Ogneopasnost' reaktivnykh topliv)

PERIODICAL: Khimiya i Tekhnologiya Topliv i Masel, 1958, Nr 4,
pp 39 - 46 (USSR)

ABSTRACT: Investigations were carried out on the inflammable properties of five types of jet fuels: the physicochemical properties of these fuels are given in Table 1. The apparatus developed by M. G. Godzhello and Z. V. Korshak of The Research Institute for Fire Protection, MVD (Nauchno-issledovatel'skiy institut pozharnoy okhrany MVD), was used for investigating the explosion hazards of mixtures of vapours of jet fuels with air. The method of the TsNIPO was used for defining the lower and upper limits of ignition of fuels at atmospheric pressure. The advantage of this method lies in the defining of the temperature limits at which explosive mixtures of fuel vapours with air are formed. The coefficient of explosion hazard of a mixture is taken as the ignition of a mixture on the incandescent spiral, which is accompanied by explosion and sound of explosion of varying intensity. The temperature limits of explosion hazards of mixtures of fuel vapours of the kerosene type (T-1, TC-1, T-2) and of B-70 in relation

Card 1/2

The Inflammability of Jet Fuels

65-58-4-7/12

to the height were determined. The height (rarefaction) at which formation of too rich mixtures takes place was defined, and it was found that the explosion hazard of such a mixture is not constant. The temperature of spontaneous ignition of the fuels was determined according to the method of V. A. Safonov at the NII GVF. This method makes it possible to determine simultaneously the temperature of spontaneous ignition and the temperature of the heated metallic surface, at which the fuel can ignite upon contact with the heated surface. Results of these experiments are given in Table 5. Data on the effect of the height (lowering of pressure) on the temperature of spontaneous combustion of aviation fuels, quoted by M. Zabetakis in his article "Minimum Spontaneous Ignition Temperature Combustibles in Air" are given in Table 7. Table 10 gives the characteristics of inflammability of jet fuels. The relation of the flash point of a fuel and the vapour tension of the gases was determined. Comparative data on the flash point of jet fuels in the USA and USSR are given (Table 6). There are 10 Tables, 1 Figure (page 41), 8 References: 4 Russian, 4 English.

TITLE: Studies Concerning the Stabilization of Polyvinyl Chloride.
Report No. 2. Epoxidation of Vegetable Oils and Cod Liver Oil,
and Their Use as Stabilizers and Plasticizers for Polyvinyl
Chloride

PERIODICAL: Plasticheskiye massy, 1960, No. 11, pp. 20-23

TEXT: The authors report on the epoxidation of castor oil, cottonseed oil, sunflower oil, linseed oil, and cod liver oil, as well as on their use to stabilize and plasticize polyvinyl chloride. The epoxidation may be conducted with peracetic or performic acid by two methods: a) in two stages: by production of the peracid and subsequent epoxidation; b) in one stage: by simultaneous production of peracid and epoxidation. The second method proved to be much more efficient: in some cases, epoxidation was performed up to 80%, with a duration of process 33-40% shorter, and a consumption of organic acid of 1/25 - 1/30, as compared to method a). Table 2 gives the viscosity of oils before and after the treatment. It was

Card 1/2

Studies Concerning the Stabilization of S/191/60/000/011/006/016
Polyvinyl Chloride. Report No. 2. Epoxidation B013/B054
of Vegetable Oils and Cod Liver Oil, and Their
Use as Stabilizers and Plasticizers for Poly-
vinyl Chloride

shown that by the treatment of vegetable oils and cod liver oil with organic peracids, products are formed whose degree of epoxidation is varying (60-80%), and whose content of epoxy oxygen lies between 3 and 7%. Epoxidized sunflower, cottonseed, and linseed oils stabilize polyvinyl chloride by increasing its decomposition temperature and heat resistance (Table 3). The optimum amount of epoxidized oils in the composition is 10% referred to polyvinyl chloride. As to their stabilizing effect, the oils mentioned correspond to calcium- and cadmium stearate. The stabilizing effect of epoxidized oils decreases in the following order: cottonseed, sunflower, linseed oil. It was shown that with the use of a mixture of epoxidized cottonseed oil with lead stearate, a considerable synergistic effect appears only with respect to decomposition temperature and heat resistance of polyvinyl chloride (Table 4). Its resistance to light, however, is not influenced by this effect. A. I. Rybakova, chemical engineer, assisted in the experimental work. There are 4 figures, 4 tables, and 10 references: 2 Soviet, 6 US, 1 French, and 1 Dutch.

химии. Сессия III. (International Symposium on Macromolecular
Chemistry) Held in Moscow, June 1-13, 1960; Papers and
Summaries) Session III. [Moscow, Izd-vo AN SSSR, 1960].
No. 9. P. 55,000 copies printed.

Edch. Ed.: F. S. Kishinev.

Sponsoring Agency: The International Union of Pure and Applied
Chemistry. Commission on Macromolecular Chemistry.

Purpose: This book is intended for chemists interested in polymerization reactions and the synthesis of high molecular compounds.

Content: This is Section III of a multi-volume work containing papers on macromolecular chemistry. The articles are general deal with the kinetics of polymerization reactions, the synthesis of special-purpose polymers, e.g., ion exchange resins, semiconductor materials, etc., methods of catalyzing polymerization reactions, properties and chemical interaction of high molecular materials, and the effects of various factors on polymerization and the degradation of high molecular compounds. No personalities are mentioned. References given follow the articles.

Title : The Determination of C-Reactive Protein in Rheumatism.

Orig Pub : Terapevt. arkhiv, 1957, 29, No 8, 31-36

Abstract : The C-reactive protein (CP), as determined by the method of precipitation by a specific antiserum, was not found in the serum of 15 healthy subjects. In 24 out of 31 patients with active rheumatism the reaction to CP was positive. CP disappeared from the serum in 16 patients usually before the normalization of the sedimentation rate following antirheumatic treatment. The reaction to CP remained positive in the others (patients with severe decompensation or non-rheumatic inflammatory processes). CP was found in 4 out of 12 patients with inactive

rheumatism; 3 of those had a high titer of streptococcal
antihyaluronidase and antistreptolysin-O which led to the
recognition of the presence, in these subjects, of an ac-
tive process. During the performance of the commissurotomy
operation in 1 out of 7 patients, regardless of a negati-
ve reaction for CP, numerous granulomas, i.e., changes
of productive character, were found; there were no exu-
dative manifestations present. It is assumed that CP is
demonstrated in rheumatism during the phase of exudative
changes. Increase of CP in the blood of patients with
active rheumatism in correspondence with the severity of
the process and a correlation between the presence of CP
and the sedimentation rate, particularly at the height of
the disease, were noted. A positive reaction to CP in
patients with decompensated heart injury indicates activi-
ty of the rheumatic process regardless of a normal

TITLE: Study of buffer properties, electrical conductivity and the cathode process in solutions of chromium chloride in hydrochloric acid

PERIODICAL: Zhurnal prikladnoy khimii, v. 34, no. 8, 1961,
1759-1764

TEXT: Production of Cr metal by electrolysis of its trivalent compounds has several advantages over the electrolysis of the hexavalent compounds. Electrolysis of CrCl_3 solutions has particular interest, since, in addition to producing the metal, chlorine is also produced at the anode, which can be utilized in the chlorination cycle of chrome ores. Technical and economic calculations show that production of CrCl_3 by ore chlorination is much cheaper than well-known methods of chrome ore treatment. The object of the work reported in the present paper was to study the effect of various additives in improving the electrodeposition of Cr metal from

Card 1/3

S/080/61/034/008/008/018
D204/D305

Study of buffer properties...

CrCl_3 in HCl solutions. The additives studied were: urea, NH_4Cl , $(\text{NH}_4)_2\text{SO}_4$, NH_4BF_4 and NH_4F . Buffer properties were studied by adding small portions of 3N HCl to 100 ml of solution, with continuous mixing, measuring pH value potentiometrically after each such addition. Electrical conductivity of the solutions was measured by a compensation technique. The conductivity of pure CrCl_3 solution varies only slightly with its concentration; addition of buffering compounds increases its conductivity considerably. It was found that addition of NH_4Cl does not impart the required character to the electrolyte and that NH_4F and NH_4BF_4 are the most effective additives for the purpose studied. Solutions containing them have high buffer capacities in the requisite pH range of 1.7 - 2.2 and higher electrical conductivity. Cathodic polarization determination showed that with these two additives, Cr deposition takes place at a lower current density ($4 - 5 \text{ A/dm}^2$) than with other additives and with a current efficiency of 39 - 40%. The metal obtained was light in color and dense in nature. There are 3 figures, 3 tables and 5 references: 4 Soviet-bloc and 1 non-Soviet-bloc. The refer-

TITLE: Scientific Conference on Problems of Working Productivity 14

PERIODICAL: Vestnik Akademii nauk SSSR, 1960, Nr 1, p 80 (USSR)

ABSTRACT: The Conference was held in Budapest from September 29 to October 2, 1959, and had been convened by the Hungarian Academy of Sciences in accordance with the plan of the scientists of the Socialist countries, concerning social-economic problems. In addition to Hungarian delegates from economic institutes, the Conference was attended by delegates ✓ from Bulgaria, the USSR, Czechoslovakia, Eastern Germany, Rumania, and Poland. The opening speech was held by Academician Istvan Fris, member of the Central Committee of the Hungarian Socialist Labor Party. The major part of the lectures was devoted to problems of methods in measuring, planning, and to the international comparison of working productivity. The discussions included also the part played by various factors in the increase of working productivity, especially to techni-

This collection of articles sums up the principal results of investigations and studies made by Prof. A. A. Gorev, Dr. Tech. Sci., and his staff in the field of high voltage phenomena and techniques at LPI (Leningrad Polytech Inst.). It was at this institute that Prof. Gorev completed his higher scientific education and then taught and carried on his investigations in the field until his death in 1953. In 1956, by decree of Min of Higher Education, the High-Voltage Lab. at LPI was named after A. A. Gorev.
